Re: Short-Term Radon Measurement Assessment Report Central Elementary School 925 H Avenue Nevada, Iowa 50201 Terracon Project No. 08237091R

Dear Mr. Kroese:

Terracon Consultants, Inc. (Terracon) collected short-term radon measurements at Central Elementary Community School on behalf of the Nevada Community School District (NCSD). This measurement event was conducted in accordance with Terracon's Proposal No. P08237091 dated May 2, 2023. Terracon collected short-term radon measurements from October 23 to 27, 2023, and conducted re-testing activities from November 27 to December 1, 2023. The objective of this work was to evaluate radon concentrations within the school based on the new Iowa House File 2412 act requiring all Iowa public school districts to perform radon testing at each of the attendance centers by July 1, 2027.

Terracon appreciates the opportunity to provide services to you. If we can provide additional environmental, occupational health, or safety-related services, please contact us at (515) 244-3184.

Sincerely, Terracon Consultants, Inc. Prepared by:

Centri Pathao/

Austin J. Potthoff Project Manager

## 1.0 Field Activities

#### 1.1 Initial Short-Term Testing

Radon measurements were collected from October 23 to 27, 2023, by a State of Iowa certified radon measurement specialist in accordance with Terracon's Radon Testing Quality Assurance Plan for Activated Charcoal Adsorption (QAP) and the American National Standards Institute (ANSI) / American Association of Radon Scientists and Technologies (AARST) Protocol for Conducting Measurements of Radon and Radon Decay Products in Schools and Large Buildings. Terracon's QAP is based on guidelines set forth by the United States Environmental Protection Agency (USEPA) and the Iowa Department of Public Health (IDPH). Radon measurements were collected by Mr. Austin Potthoff (certification number RNTST10075). A copy of Mr. Potthoff's certification can be found in Appendix C in this report.

Terracon informed NCSD that closed-building conditions would be required beginning 12 hours prior to the test and continuing for the duration of the test. Terracon did not observe deviations from the closed-building conditions while placing or upon retrieval of the devices.

The radon devices were placed between two feet and less than eight feet above the floor surface, a minimum of one foot from exterior walls, in areas of normal air circulation, away from air vents, and a minimum of three feet from exterior doors and windows. Heating, ventilating, and air-conditioning (HVAC) systems in the areas were set to auto and appeared to be working properly. Terracon collected 80 measurements in the building using activated charcoal devices obtained from an Iowa-certified laboratory. Terracon submitted two field blanks, two lab blanks, and eight duplicates to the laboratory for quality control purposes. Field logs from the initial testing period summarizing the analytical results, measurement locations, blanks, and duplicates can be found in Appendix A of this report.

The activated charcoal devices used for the testing were shipped under chain-of-custody to AirChek, Inc., in Mills River, North Carolina for analysis to detect gamma rays by scintillation counting using sodium iodide detectors. AirChek, Inc. is an Iowa-certified radon laboratory (#L00009).

#### 1.2 Short-Term Re-testing

Terracon collected additional short-term measurements from November 27 to December 1, 2023, in initially tested spaces indicated to have radon levels above the action level of 4.0 pCi/L. USEPA and IDPH guidance indicates spaces with initial testing results at or above 4.0 pCi/L should be re-tested, and results averaged with initial testing results to determine the possible need for mitigation.

### 2.0 Radon Guidance

The following has been excerpted from the ANSI/AARST<sup>1</sup> Protocol for Conducting Radon Measurements in Schools and Large Buildings (MALB-2014), Section II: iv, Guidance for Building Managers and reflects guidance from the USEPA regarding recommended actions based on initial radon testing:

- 4.0 picoCuries per liter (pCi/L) or greater: If testing indicates radon concentrations equal to or greater than 4.0 pCi/L, reduce the radon to below 4.0 pCi/L in any office area, classroom, exercise facility, meeting room, dining area or other common area. The higher the radon concentration, the more quickly action should be taken to reduce the concentrations.
- Below 4.0 pCi/L: Radon concentrations below 4.0 pCi/L still pose a risk to occupants. Consider fixing the building if test results indicate radon concentrations between 2.0 and 4.0 pCi/L. Note that reducing and accurately confirming radon concentrations of about 2.0 pCi/L or below may be difficult. If test results are below the action level, confirm the low results by testing again, at least every 5 years and whenever significant changes to the building's structure or mechanical systems occur.
- Non-Residential Rooms/Enclosed Spaces: Radon concentrations should be reduced if either of these areas are occupiable with little or no modification and/or these areas serve as a source of radon into occupied areas of upper story floors that have radon concentrations equal to or greater than 4.0 pCi/L.

## 3.0 Summary of Findings

#### 3.1 Initial Testing

Analytical results indicated that radon concentrations were detected above 4.0 pCi/L in some of the samples collected. Radon concentrations ranged from less than (<) 0.3 to 4.4 pCi/L. Analytical results for devices collected for quality control purposes were found to be within control limits. These results are used to help measure precision and evaluate bias associated with radon concentration measurements. The laboratory report is attached.

Rooms with reported radon concentrations greater than the 4.0-pCi/L EPA action level are highlighted in the analytical report in Appendix B and include:

<sup>&</sup>lt;sup>1</sup> American National Standards Institute/American Association of Radon Scientists and Technologists

- Room 57 (4.0 pCi/L)
- Room 68 (4.3 pCi/L)
- Room 69 (4.4 pCi/L)
- Gym Sample 'C' (4.3 pCi/L). Note that the average of the four Gym measurements is 3.8 pCi/L, which is below the EPA action level.

Following verbal receipt of the testing results, the Buildings and Grounds Manager for NCSD, Mr. Dave Kroese, indicated that it appeared that some fresh air vents in Rooms 57 and 69 were covered at the time of the testing. It is also worth noting that it was unseasonably warm the week that testing was conducted, and it is likely that the HVAC systems were not supplying fresh outdoor air at the rate they typically would in late October in Nevada, Iowa. Both of these situations could have contributed to the radon concentrations measured. Mr. Kroese indicated the HVAC systems supplying air to these spaces would be examined to determine if they are working at full capacity prior to re-testing activities.

Please note that there is some uncertainty associated with radon measurements. Factors that effect this uncertainty include but are not limited to, variations related to seasonal weather and operation of building mechanical equipment. Even during normal weather, indoor radon levels may rise and fall by a factor of two on a daily cycle; for example, from 5 pCi/L to 10 pCi/L in 24 hours. During rapidly changing or stormy weather, the levels may change more dramatically. Bear in mind that any radon test returns only the average of the levels present during the time of testing at the precise location of the test. Conditions during a different test period or at a different location in the building are expected to be different.

#### 3.2 Re-Testing

Re-testing locations and results are indicated below:

- Room 57 (3.0 pCi/L)
- Room 68 (3.3 pCi/L)
- Room 69 (3.2 pCi/L)

The average of these re-testing results with their respective initial testing results are all below the USEPA action level.

#### 4.0 Recommendations

Based on the analytical results of the radon measurements and USEPA and IDPH guidance, Terracon recommends the following:

Additional testing should take place when one or more of the following conditions are met:

- A new addition is added;
- HVAC equipment is added, removed, replaced, operated differently or improperly maintained;
- Significant changes to the slab or foundation, such as major cracks or penetrations from natural settling, or water proofing or groundwater control efforts;
- An installed mitigation system is altered, modified, or repaired;
- A ground contact area that was not previously tested is occupied; or
- Every 5 years based on Iowa House File 2412.

#### 5.0 General Comments

This radon measurement event was conducted in a manner consistent with the level of care and skill ordinarily exercised by members of the profession currently practicing under similar conditions in the same locale. The results, findings, and recommendations expressed in this report are based on conditions observed during our survey of the building. The information contained in this report is relevant to the date on which this survey was conducted and should not be relied upon to represent conditions at a later date. This report has been prepared on behalf of and exclusively for use by the Nevada Community School District, for specific application to their project as discussed. This report is not a bidding document. Contractors, consultants, or others reviewing this report must draw their own conclusions regarding further investigation or remediation deemed necessary. Terracon does not warrant the work of regulatory agencies, laboratories, or other third parties supplying information that may have been used in the preparation of this report. No warranty, express or implied is made.
